## **GROUNDPROBE LAUNCHES TWO NEW PRODUCTS IN CHILE**

### **SSR T-Series™ and GeoSeer™**

Her Excellency the Ambassador of Australia, Virginia Greville, hosted a reception promoting Australian innovation in mine safety, showcasing GroundProbe's latest product developments. The prestigious event was held at the Ambassador's official residence and was attended by over a hundred of the Mining Industry's VIPs including local and international representatives from Anglo American, Barrick, BHP Billiton, Codelco, Freeport, Kinross, Newmont, Orica, SRK, SKM, Thiess and Xstrata.

According to Ian Frederick, Post Manager – Austrade Santiago, although apparently a mature market, Chile presents a major opportunity for Australian mining technologies to launch and springboard into the global mining industry.

At the Ambassador's reception, Australian company GroundProbe which is expanding into a second office in Antofagasta, officially launched two of its new products to the international mining industry.

David Noon, GroundProbe's Chief Commercial Officer, announces "Today we are proud to be in Santiago to launch two new exciting products to the global mining industry. The first is our new GeoSeer product that provides a wealth of benefits to key stakeholders of open-pit mines by enabling better operational decisions from geotechnical data. The second is our latest generation of Slope Stability Radar, which provides improved range performance and survey-controlled integration with mine systems to better manage mining with unstable slopes."

With the launch of their GeoSeer slope management system, the transition from slope monitoring to complete slope management offers open-cut mines a wealth of benefits never offered before in one system.

On Sunday, GroundProbe hosted its annual international user's conference in Santiago, with users coming from Chile, Peru, China, USA, Canada, South Africa and Australia to present their experiences with managing unstable slopes. "We are very grateful to have a global user community for sharing ideas and best practices towards improving safety and productivity", says Mr Noon.
